# Bella Hat documentation

## Bella Hat Library

### Install

1. Update your system.

Make sure you are connected to the Internet and update your system:

```
sudo apt update
```

#### Note

Python3 related packages must be installed if you are installing the **Lite** version OS.

```
sudo apt install git python3-pip python3-setuptools python3-smbus
```

2. Download the source code.

```
git clone https://github.com/sunfounder/bella-hat.git
```

3. Install the package.

It is recommended to install within a Python virtual environment.

```
cd bella-hat
pip3 install ./
```

#### Note

if you want to install in system environment. You need add parameter “--break-system-packages”

```
pip3 install ./ --break-system-packages
```

## Examples

### Basic test

```
cd bella-hat
python3 examples/basic_test.py
```

```

      ↑
←  →  power:  020    020    020
      ↓

Battery:  |||||  |  81.6  8.08 V
Ultrasonic: 5.99 cm
DHT11:    temperature: 28°C  humidity: 58%
LSM6DSOX: acc: X:0.52,  Y: -0.42,  Z: 9.87 m/s^2
          gyro X:-0.01,  Y: 0.00,   Z: 0.01 radians/s
Grayscale: [818, 877, 544]
Fan:      off
Btn:      released

Move: [W,A,S,D]  STOP: [X]  Honk: [Q]  Fan: [E]
```

## Reset MCU

Reset the MCU on the Bella HAT.

```
bella-hat reset_mcu
```

## Reference

### class Bella

The class `Bella` encapsulates the usage functions of all physical interfaces on the Bella HAT and presets the corresponding pin numbers. For a more detailed example, you can refer to the `examples/basic_test.py` file.

#### Example

```
from bella_hat.bella import Bella

bella = Bella()
bellas.et_motors_reverse(True, False)

bella.set_eyes_led(80, 80)
bella.set_motors(20, 20)
bella.fan_on()

batVolt = bella.get_battery_voltage()
batPerc = bella.get_battery_percentage()
distance = bella.get_ultrasonic_distance()
temp = bella.get_temperature()
hum = bella.get_humidity()
grayscale = bella.get_grayscales()
acc = bella.get_acc()
gyro = bella.get_gyro()
btn_state = bella.read_btn()
print(f'''
Battery:      {batPerc:.1f} {batVolt:.2f} V
Ultrasonic:   {distance} cm
DHT11:        temperature: {temp}'C    humidity: {hum}%
LSM6DSOX:     acc: X:{acc[0]:.2f},      Y: {acc[1]:.2f},      Z: {acc[2]:.2f} m/s^2
               gyro X:{gyro[0]:.2f},    Y: {gyro[1]:.2f},    Z: {gyro[2]:.2f} radians/s
Grayscale:    {grayscale}
Fan:          {"on" if bella.fan_state else "off"}
Btn:          {"pressed" if btn_state else "released"}
''')
```

#### API

```
class bella_hat.bella.Bella(*args, **kwargs)
    Bases: _Basic_class
```

```
__init__(*args, **kwargs)
    Initialize the basic class
```

**Parameters:** `debug_level` (*str/int*) – debug level, 0(critical), 1(error), 2(warning), 3(info) or 4(debug)

```
get_battery_voltage()
    ' Get the battery voltage.
    return: float - Battery voltage in volts.
```

```
get_battery_percentage()
    Get the battery percentage.
    return: float - Battery percentage.
```

#### **get\_ultrasonic\_distance ()**

Get the distance from the ultrasonic sensor.

**return: float - Distance in cm.**

-1, timeout -2, distance limit exceeded

#### **get\_temperature ()**

Get the temperature from the DHT11 sensor.

return: float - Temperature in Celsius.

#### **get\_humidity ()**

Get the humidity from the DHT11 sensor.

return: float - Humidity in percentage.

#### **get\_grayscales ()**

Get the grayscale sensor values.

return: list - Grayscale sensor values.

#### **set\_motors (leftPercent, rightPercent)**

Set the motor percentage for left and right motors

leftPercent: int - Motor percentage for left motor, -100 to 100 rightPercent: int - Motor percentage for right motor, -100 to 100

#### **set\_motors\_reverse (left\_reverse, right\_reverse)**

Set the motors is reversed or not

left\_reverse: bool - set left motor is reversed or not right\_reverse: bool - set right motor is reversed or not

#### **get\_acc ()**

Get acceleration data of lsm6dsox sensor.

return: list - [acc\_x, acc\_y, acc\_z].

#### **get\_gyro ()**

Get gyro data of lsm6dsox sensor.

return: list - [gyro\_x, gyro\_y, gyro\_z].

#### **fan\_on ()**

Open the fan on Bella HAT.

#### **fan\_off ()**

Close the fan on Bella HAT.

#### **read\_btn ()**

Read the state of btn on Bella HAT.

#### **set\_eyes\_led (left\_brightness, right\_brightness)**

Set the front board LEDs brightness.

left\_brightness: int - brightness for left LEDs, 0 to 100 right\_brightness: int - brightness for right LEDs, 0 to 100

### **class Pin**

#### **Example**

Simple read or control pin:

```
# Import Pin class
from robot_hat import Pin

# Create Pin object with numeric pin numbering and default input pullup enabled
d0 = Pin(16, Pin.IN, Pin.PULL_UP)
# Create Pin object with named pin numbering
d1 = Pin(25)
```

```
# read value
value0 = d0.value()
value1 = d1.value()
print(value0, value1)

# write value
d0.value(1) # force input to output
d1.value(0)

# set pin high/low
d0.high()
d1.off()
```

#### Interrupt:

```
# Import Pin class
from bella_hat.pin import Pin

# set interrupt
led = Pin(16, Pin.OUT)
switch = Pin(25, Pin.IN, Pin.PULL_DOWN)
def onPressed(chn):
    led.value(not switch.value())
switch.irq(handler=onPressed, trigger=Pin.IRQ_RISING_FALLING)

while True:
    pass
```

#### API

`class bella_hat.pin.Pin` (pin, mode=None, pull=None, \*args, \*\*kwargs)

Bases: `_Basic_class`

Pin manipulation class

`OUT = 1`  
Pin mode output

`IN = 2`  
Pin mode input

`PULL_UP = 17`  
Pin internal pull up

`PULL_DOWN = 18`  
Pin internal pull down

`PULL_NONE = None`  
Pin internal pull none

`IRQ_FALLING = 33`  
Pin interrupt falling

`IRQ_RISING = 34`  
Pin interrupt falling

`IRQ_RISING_FALLING = 35`  
Pin interrupt both rising and falling

`__init__` (pin, mode=None, pull=None, \*args, \*\*kwargs)  
Initialize a pin

**Parameters:**

- **pin** (*int/str*) – pin number of Raspberry Pi
- **mode** (*int*) – pin mode(IN/OUT)
- **pull** (*int*) – pin pull up/down(PUD\_UP/PUD\_DOWN/PUD\_NONE)

**setup** (mode, pull=None)

Setup the pin

**Parameters:**

- **mode** (*int*) – pin mode(IN/OUT)
- **pull** (*int*) – pin pull up/down(PUD\_UP/PUD\_DOWN/PUD\_NONE)

**dict** (\_dict=None)

Set/get the pin dictionary

**Parameters:** **\_dict** (*dict*) – pin dictionary, leave it empty to get the dictionary

**Returns:** pin dictionary

**Return type:** dict

**\_\_call\_\_** (value)

Set/get the pin value

**Parameters:** **value** (*int*) – pin value, leave it empty to get the value(0/1)

**Returns:** pin value(0/1)

**Return type:** int

**value** (value: bool = None)

Set/get the pin value

**Parameters:** **value** (*int*) – pin value, leave it empty to get the value(0/1)

**Returns:** pin value(0/1)

**Return type:** int

**on** ()

Set pin on(high)

**Returns:** pin value(1)

**Return type:** int

**off** ()

Set pin off(low)

**Returns:** pin value(0)

**Return type:** int

**high** ()

Set pin high(1)

**Returns:** pin value(1)

**Return type:** int

**low** ()

Set pin low(0)

**Returns:** pin value(0)

**Return type:** int

**irq** (handler, trigger, bouncetime=200, pull=None)

Set the pin interrupt

**Parameters:**

- **handler** (*function*) – interrupt handler callback function
- **trigger** (*int*) – interrupt trigger(RISING, FALLING, RISING\_FALLING)
- **bouncetime** (*int*) – interrupt bouncetime in miliseconds

**name ()**

Get the pin name

**Returns:** pin name**Return type:** str**class** ADC**Example**

```
# Import ADC class
from bella_hat.adc import ADC

# Create ADC object with numeric pin numbering
a0 = ADC(0)
# Create ADC object with named pin numbering
a1 = ADC('A1')

# Read ADC value
value0 = a0.read()
value1 = a1.read()
voltage0 = a0.read_voltage()
voltage1 = a1.read_voltage()
print(f"ADC 0 value: {value0}")
print(f"ADC 1 value: {value1}")
print(f"ADC 0 voltage: {voltage0}")
print(f"ADC 1 voltage: {voltage1}")
```

**Read Battery voltage on Bella bella-hat:**

The battery voltage measurement terminal is connected to ADC channel 4 and divided by 3 times

```
# Import ADC class
from bella_hat.adc import ADC

BAT_VOLT_GAIN = 3
bat = ADC('A4')

bat_value = bat.read()
bat_voltage = bat.read_voltage() * BAT_VOLT_GAIN
print(f"Battery adc value: {bat_value}, voltage: {bat_voltage:.2f} V")
```

**API**

```
class bella_hat.adc.ADC (chn, address=None, *args, **kwargs)
```

Bases: **I2C**

Analog to digital converter

```
__init__ (chn, address=None, *args, **kwargs)
```

Analog to digital converter

**Parameters:** **chn** (*int/str*) – channel number (0-7/A0-A7)**read ()**

Read the ADC value

**Returns:** ADC value(0-4095)

**Return type:** int

#### **read\_voltage ()**

Read the ADC value and convert to voltage

**Returns:** Voltage value(0-3.3(V))

**Return type:** float

### **class PWM**

#### **Example**

```
# Import PWM class
from bella_hat.pwm import PWM

# Create PWM object with numeric pin numbering and default input pullup enabled
p0 = PWM(0)
# Create PWM object with named pin numbering
p1 = PWM('P1')

# Set frequency will automatically set prescaler and period
# This is easy for device like Buzzer or LED, which you care
# about the frequency and pulse width percentage.
# this usually use with pulse_width_percent function.
# Set frequency to 1000Hz
p0.freq(1000)
print(f"Frequency: {p0.freq()} Hz")
print(f"Prescaler: {p0.prescaler()}")
print(f"Period: {p0.period()}")
# Set pulse width to 50%
p0.pulse_width_percent(50)

# Or set prescaler and period, will get a frequency from:
# frequency = PWM.CLOCK / prescaler / period
# With this setup you can tune the period as you wish.
# set prescaler to 64
p1.prescaler(64)
# set period to 4096 ticks
p1.period(4096)
print(f"Frequency: {p1.freq()} Hz")
print(f"Prescaler: {p1.prescaler()}")
print(f"Period: {p1.period()}")
# Set pulse width to 2048 which is also 50%
p1.pulse_width(2048)
```

#### **API**

`class bella_hat.pwm.PWM(channel, address=None, *args, **kwargs)`

Bases: **I2C**

Pulse width modulation (PWM)

**REG\_CHN** = 32

Channel register prefix

**REG\_PSC** = 64

Prescaler register prefix

**REG\_ARR** = 68

Period register prefix

**REG\_PSC2 = 80**  
Prescaler register prefix

**REG\_ARR2 = 84**  
Period register prefix

**CLOCK = 72000000.0**  
Clock frequency

**\_\_init\_\_**(channel, address=None, \*args, \*\*kwargs)  
Initialize PWM

**Parameters:** **channel** (*int/str*) – PWM channel number(0-13/P0-P13)

**freq**(freq=None)  
Set/get frequency, leave blank to get frequency

**Parameters:** **freq** (*float*) – frequency(0-65535)(Hz)

**Returns:** frequency

**Return type:** float

**prescaler**(prescaler=None)  
Set/get prescaler, leave blank to get prescaler

**Parameters:** **prescaler** (*int*) – prescaler(0-65535)

**Returns:** prescaler

**Return type:** int

**period**(arr=None)  
Set/get period, leave blank to get period

**Parameters:** **arr** (*int*) – period(0-65535)

**Returns:** period

**Return type:** int

**pulse\_width**(pulse\_width=None)  
Set/get pulse width, leave blank to get pulse width

**Parameters:** **pulse\_width** (*float*) – pulse width(0-65535)

**Returns:** pulse width

**Return type:** float

**pulse\_width\_percent**(pulse\_width\_percent=None)  
Set/get pulse width percentage, leave blank to get pulse width percentage

**Parameters:** **pulse\_width\_percent** (*float*) – pulse width percentage(0-100)

**Returns:** pulse width percentage

**Return type:** float

**module** motor

**class** Motors

### Example

Initilize

```
# Import Motor class
from bella_hat.motor import Motors
```

```
# Create Motor object
motors = Motors()
# Create Motor object with setting motors direction
# motors = Motors(left_reversed=True, right_reversed=False)
```

Control motors power.

```
#
motors.speed([50, 50])
# stop
motors.stop()
```

Setup motor direction.

```
# Go forward and see if both motor directions are correct
motors.forward(100)
# if you found a motor is running in the wrong direction
# Use these function to correct it
motors.reverse(True, True) # [left_reverse, right_reverse]
# Run forward again and see if both motor directions are correct
motors.forward(100)
```

Move functions

```
import time

motors.forward(100)
time.sleep(1)
motors.backward(100)
time.sleep(1)
motors.turn_left(100)
time.sleep(1)
motors.turn_right(100)
time.sleep(1)
motors.stop()
```

## API

```
class bella_hat.motor.Motors (left_motor_pwm=18, left_motor_pwm=19, right_motor_pwm=16,
right_motor_pwm=17, left_reversed=False, right_reversed=False, *args, **kwargs)
```

Bases: `_Basic_class`

```
__init__ (left_motor_pwm=18, left_motor_pwm=19, right_motor_pwm=16,
right_motor_pwm=17, left_reversed=False, right_reversed=False, *args, **kwargs)
Initialize motors with bella_hat.motor.Motor
```

### Parameters:

- **left\_motor\_pwm** (*int, pin number*) – pwm input for left motor
- **left\_motor\_pwm** (*int, pin number*) – pwm input for left motor
- **right\_motor\_pwm** (*int, pin number*) – pwm input for right motor
- **right\_motor\_pwm** (*int, pin number*) – pwm input for right motor
- **left\_reversed** (*bool*) – whether to reverse left motor
- **right\_reversed** (*bool*) – whether to reverse right motor

```
stop ()
Stop all motors
```

```
brake ()
Brake
```

```
reverse (reverse=None)
```

Get or set motors is reversed or not

**Parameters:** **reverse** (*[bool, bool]*) – [left\_reverse, right\_reverse]

**speed** (*speed=None*)

Get or Set motors speed

**Parameters:** **speed** (*[float/int, float/int]*) – [left\_speed, right\_speed] (-100.0~100.0)

**forward** (*speed*)

Forward

**Parameters:** **speed** (*float*) – Motor speed(-100.0~100.0)

**backward** (*speed*)

Backward

**Parameters:** **speed** (*float*) – Motor speed(-100.0~100.0)

**turn\_left** (*speed*)

Left turn

**Parameters:** **speed** (*float*) – Motor speed(-100.0~100.0)

**turn\_right** (*speed*)

Right turn

**Parameters:** **speed** (*float*) – Motor speed(-100.0~100.0)

```
class Motor
```

### Example

```
# Import Motor class
from bella_hat.motor import Motor, PWM, Pin

# Create Motor object
motor = Motor(18, 19) # pwma, pwmb

# Motor clockwise at 100% speed
motor.speed(100)
# Motor counter-clockwise at 100% speed
motor.speed(-100)

# If you like to reverse the motor direction
motor.reverse(True)
```

### API

```
class bella_hat.motor.Motor (pwma, pwmb, reversed=False)
```

Bases: **object**

**\_\_init\_\_** (*pwma, pwmb, reversed=False*)

Initialize a motor

**Parameters:**

- **pwma** (*pin number*) – Motor speed control pwm input A pin
- **pwmb** (*pin number*) – Motor speed control pwm input B pin

**Reversed:** Whether to reverse the direction of motor rotation

**speed** (*speed=None*)

Get or set motor speed

**Parameters:** **speed** (*int or float*) – Motor speed(-100.0~100.0)

**reverse** (*reverse=None*)

Get or set motor is reversed or not

**Parameters:** **reverse** (*bool*) – True or False

**brake** ()

**stop** ()

## class I2C

### Example

```
# Import the I2C class
from bella_hat.i2c import I2C

# You can scan for available I2C devices
print([f"0x{addr:02X}" for addr in I2C().scan()])
# You should see at least one device address 0x14, which is the
# on board MCU for PWM and ADC

# Initialize a I2C object with device address, for example
# to communicate with on board MCU 0x14
mcu = I2C(0x14)
# Send ADC channel register to read ADC, 0x10 is Channel 0, 0x11 is Channel 1, etc.
mcu.write([0x10, 0x00, 0x00])
# Read 2 byte for MSB and LSB
msb, lsb = mcu.read(2)
# Convert to integer
value = (msb << 8) + lsb
# Print the value
print(value)
```

For more information on the I2C protocol, see checkout [adc.py](#) and [pwm.py](#)

### API

`class bella_hat.i2c.I2C (address=None, bus=1, *args, **kwargs)`

Bases: `_Basic_class`

I2C bus read/write functions

`__init__ (address=None, bus=1, *args, **kwargs)`

Initialize the I2C bus

**Parameters:**

- **address** (*int*) – I2C device address
- **bus** (*int*) – I2C bus number

**static scan** (busnum=1, force=False)

Scan the I2C bus for devices

**Returns:** List of I2C addresses of devices found

**Return type:** list

**write** (data)

Write data to the I2C device

**Parameters:** **data** (*int/list/bytearray*) – Data to write

**Raises:** `ValueError` if write is not an int, list or bytearray

**read** (length=1)

Read data from I2C device

**Parameters:** **length** (*int*) – Number of bytes to receive**Returns:** Received data**Return type:** list**mem\_write** (data, memaddr)

Send data to specific register address

**Parameters:**

- **data** (*int/list/bytearray*) – Data to send, int, list or bytearray
- **memaddr** (*int*) – Register address

**Raises:** **ValueError** – If data is not int, list, or bytearray**mem\_read** (length, memaddr)

Read data from specific register address

**Parameters:**

- **length** (*int*) – Number of bytes to receive
- **memaddr** (*int*) – Register address

**Returns:** Received bytearray data or False if error**Return type:** list/False**is\_avaliabile** ()

Check if the I2C device is available

**Returns:** True if the I2C device is available, False otherwise**Return type:** bool**module** modules**class** Ultrasonic**Example**

```
# Import Ultrasonic and Pin class
from bella_hat.modules import Ultrasonic, Pin

# Create Motor object
us = Ultrasonic(Pin(20), Pin(21))

# Read distance
distance = us.read()
print(f"Distance: {distance}cm")
```

**API****class** bella\_hat.modules.**Ultrasonic** (trig, echo, timeout=0.02)**\_\_init\_\_** (trig, echo, timeout=0.02)

Initialize an ultrasonic distance sensor

**Parameters:**

- **trig** (*pin number*) – trig pin
- **echo** (*pin number*) – echo pin
- **timeout** (*float, seconds*) – set the timeout for detecting the return of sound waves

**read** (times=10)  
Read the distance

**Parameters:** **times** (*int*) – retry times

**Returns:** float, distance in centimeter 1, timeout or error

```
class Grayscale_Module
```

### Example

```
# Import Grayscale_Module and ADC class
from bella_hat.modules import Grayscale_Module, ADC

# Create Grayscale_Module object, reference should be calculate from the value reads on v
# and black ground, then take the middle as reference
gs = Grayscale_Module(ADC(0), ADC(1), ADC(2), reference=[1000, 900, 1000])

# Read Grayscale_Module datas
datas = gs.read()
print(f"Grayscale Module datas: {datas}")
# or read a specific channel
l = gs.read(gs.LEFT)
m = gs.read(gs.MIDDLE)
r = gs.read(gs.RIGHT)
print(f"Grayscale Module left channel: {l}")
print(f"Grayscale Module middle channel: {m}")
print(f"Grayscale Module right channel: {r}")

# Read Grayscale_Module simple states
state = gs.read_status()
print(f"Grayscale_Module state: {state}")
```

### API

```
class bella_hat.modules.Grayscale_Module (pin0: ADC, pin1: ADC, pin2: ADC, reference:
int = None)
```

3 channel Grayscale Module

**LEFT** = 2  
Left Channel

**MIDDLE** = 1  
Middle Channel

**RIGHT** = 1  
Right Channel

**\_\_init\_\_** (pin0: ADC, pin1: ADC, pin2: ADC, reference: int = None)  
Initialize Grayscale Module

**Parameters:**

- **pin0** (*bella\_hat.ADC/int*) – ADC object or int for channel 0
- **pin1** (*bella\_hat.ADC/int*) – ADC object or int for channel 1
- **pin2** (*bella\_hat.ADC/int*) – ADC object or int for channel 2
- **reference** (*1\*3 list, [int, int, int]*) – reference voltage

**reference** (ref: list = None) → list  
Get Set reference value

**Parameters:** **ref** (*list*) – reference value, None to get reference value

**Returns:** reference value

**Return type:** list

**read\_status** (datas: list = None) → list  
Read line status

**Parameters:** **datas** (*list*) – list of grayscale datas, if None, read from sensor

**Returns:** list of line status, 0 for white, 1 for black

**Return type:** list

**read** (channel: int = None) → list  
read a channel or all datas

**Parameters:** **channel** (*int/None*) – channel to read, leave empty to read all. 0, 1, 2 or Grayscale\_Module.LEFT, Grayscale\_Module.CENTER, Grayscale\_Module.RIGHT

**Returns:** list of grayscale data

**Return type:** list

## class DHT11

### Example

```
# Import DHT11 class
from bella_hat.modules import DHT11

# Create DHT11 object
dht11 = DHT11(19)

# Read DHT11 datas
temperature = dht11.temperature
humidity = dht11.humidity
print(f"Temperature: {temperature}'C, Humidity: {humidity}%")
```

### API

**class** bella\_hat.modules.DHT11 (pin)

**\_\_init\_\_** (pin)  
Initialize DHT11 Module

**Parameters:** **pin** (*pin number*) – DHT11 data pin

*property* **temperature**  
Temperature

*property* **humidity**  
Humidity

## class LSM6DSOX

### Example

```
# Import LSM6DSOX class
from bella_hat.modules import LSM6DSOX

# Create LSM6DSOX object
lsm6dsox = LSM6DSOX()

# Read LSM6DSOX datas
acc = lsm6dsox.acc
```

```
gyro = lsm6dsox.gyro
print(f"acc: X:{acc[0]:.2f}, Y: {acc[1]:.2f}, Z: {acc[2]:.2f} m/s^2")
print(f"gyro X:{gyro[0]:.2f}, Y: {gyro[1]:.2f}, Z: {gyro[2]:.2f} radians/s")
```

## API

`class bella_hat.modules.LSM6DSOX`

```
__init__()
    Initialize LSM6DSOX Module

property acc
    Acceleration

property gyro
    Gyro
```

## `class Music`

### Example

Initialize

```
# Import Music class
from bella_hat.music import Music

# Create a new Music object
music = Music()
```

Play sound

```
# Play a sound
music.sound_play("file.wav", volume=50)
# Play a sound in the background
music.sound_play_threading("file.wav", volume=80)
# Get sound length
music.sound_length("file.wav")
```

Play Music

```
# Play music
music.music_play("file.mp3")
# Play music in loop
music.music_play("file.mp3", loop=0)
# Play music in 3 times
music.music_play("file.mp3", loop=3)
# Play music in starts from 2 second
music.music_play("file.mp3", start=2)
# Set music volume
music.music_set_volume(50)
# Stop music
music.music_stop()
# Pause music
music.music_pause()
# Resume music
music.music_resume()
```

## API

`class bella_hat.music.Music`  
 Bases: `_Basic_class`  
 Play music, sound affect and note control

`NOTE_BASE_FREQ = 440`

Base note frequency for calculation (A4)

**NOTE\_BASE\_INDEX = 69**

### Base note index for calculation (A4) MIDI compatible

[illegible]

Notes name, MIDI compatible

```
__init__()
```

## Initialize music

```
time_signature(top: int = None, bottom: int = None)
```

## Set/get time signature

### Parameters:

- **top** (*int*) – top number of time signature
- **bottom** (*int*) – bottom number of time signature

**Returns:** time signature

**Return type:** tuple

```
key_signature (key: int = None)
```

Set/get key signature

**Parameters:** **key** (*int/str*) – key signature use KEY\_XX\_MAJOR or String “#”, “##”, or “bbb”, “bbbb”

**Returns:** key signature

**Return type:** int

```
tempo (tempo=None, note_value=0.25)
```

Set/get tempo beat per minute(bpm)

### Parameters:

- **tempo** (*float*) – tempo
- **note\_value** – note value(1, 1/2, Music.HALF\_NOTE, etc)

**Returns:** tempo

**Return type:** int

**beat** (beat)

Calculate beat delay in seconds from tempo

**Parameters:** **beat** (*float*) – beat index

**Returns:** beat delay

**Return type:** float

**note** (note, natural=False)

### Get frequency of a note

### Parameters:

- **note\_name** (*string*) – note name(See NOTES)
- **natural** (*bool*) – if natural note

**Returns:** frequency of note

**Return type:** float

```
sound_play(filename, volume=None)
```

**Play sound effect file**

**Parameters:** **filename** (*str*) – sound effect file name

**sound\_play\_threading** (filename, volume=None)

Play sound effect in thread(in the background)

**Parameters:**

- **filename** (*str*) – sound effect file name
- **volume** (*int*) – volume 0-100, leave empty will not change volume

**music\_play** (filename, loops=1, start=0.0, volume=None)

Play music file

**Parameters:**

- **filename** (*str*) – sound file name
- **loops** (*int*) – number of loops, 0:loop forever, 1:play once, 2:play twice, ...
- **start** (*float*) – start time in seconds
- **volume** (*int*) – volume 0-100, leave empty will not change volume

**music\_set\_volume** (value)

Set music volume

**Parameters:** **value** (*int*) – volume 0-100

**music\_stop** ()

Stop music

**music\_pause** ()

Pause music

**music\_resume** ()

Resume music

**music\_unpause** ()

Unpause music(resume music)

**sound\_length** (filename)

Get sound effect length in seconds

**Parameters:** **filename** (*str*) – sound effect file name

**Returns:** length in seconds

**Return type:** float

**get\_tone\_data** (freq: float, duration: float)

Get tone data for playing

**Parameters:**

- **freq** (*float*) – frequency
- **duration** (*float*) – duration in seconds

**Returns:** tone data

**Return type:** list

**play\_tone\_for** (freq, duration)

Play tone for duration seconds

**Parameters:**

- **freq** (*float*) – frequency, you can use NOTES to get frequency
- **duration** (*float*) – duration in seconds

**module** `utils`

`bella_hat.utils.set_volume (value)`  
Set volume

**Parameters:** `value (int)` – volume(0~100)

`bella_hat.utils.run_command (cmd)`  
Run command and return status and output

**Parameters:** `cmd (str)` – command to run

**Returns:** status, output

**Return type:** tuple

`bella_hat.utils.is_installed (cmd)`  
Check if command is installed

**Parameters:** `cmd (str)` – command to check

**Returns:** True if installed

**Return type:** bool

`bella_hat.utils.mapping (x, in_min, in_max, out_min, out_max)`  
Map value from one range to another range

**Parameters:**

- `x (float/int)` – value to map
- `in_min (float/int)` – input minimum
- `in_max (float/int)` – input maximum
- `out_min (float/int)` – output minimum
- `out_max (float/int)` – output maximum

**Returns:** mapped value

**Return type:** float/int

`bella_hat.utils.get_ip (ifaces=['wlan0', 'eth0'])`  
Get IP address

**Parameters:** `ifaces (list)` – interfaces to check

**Returns:** IP address or False if not found

**Return type:** str/False

`bella_hat.utils.reset_mcu ()`

Reset mcu on BL100 Hat.

This is helpful if the mcu somehow stuck in a I2C data transfer loop, and Raspberry Pi getting IOError while Reading ADC, manipulating PWM, etc.

`bella_hat.utils.get_battery_voltage ()`  
Get battery voltage

**Returns:** battery voltage(V)

**Return type:** float

**class** `_Basic_class`

`_Basic_class` is a logger class for all class to log, so if you want to see logs of a class, just add a debug argument to it.

**Example**

```
# See PWM log
from bella_hat.pwm import PWM

# init the class with a debug argument
```

```
pwm = PWM(0, debug_level="debug")  
  
# run some functions and see logs  
pwm.freq(1000)  
pwm.pulse_width_percent(100)
```

## API

```
class bella_hat.basic._Basic_class(debug_level='warning')  
    Basic Class for all classes  
    with debug function
```

```
DEBUG_LEVELS = {'critical': 50, 'debug': 10, 'error': 40, 'info': 20, 'warning': 30}  
    Debug level
```

```
DEBUG_NAMES = ['critical', 'error', 'warning', 'info', 'debug']  
    Debug level names
```

```
__init__(debug_level='warning')  
    Initialize the basic class
```

**Parameters:** **debug\_level** (*str/int*) – debug level, 0(critical), 1(error), 2(warning), 3(info) or 4(debug)

```
property debug_level  
    Debug level
```
